# Exercise 1: Transition Systems, Program Graphs, Interleaving

1)

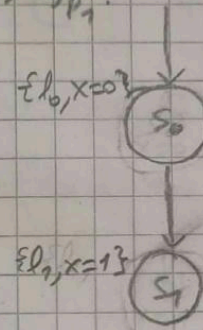

a)  $P_1$ : Initially  $x=0$        $P_2$ : Initially  $y=0$

b)  $P_1 \parallel P_2$ : Initially  $x=0$  and  $y=0$

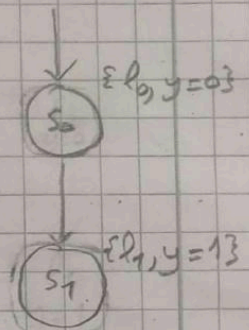

c)  $T_{P_1}$ :

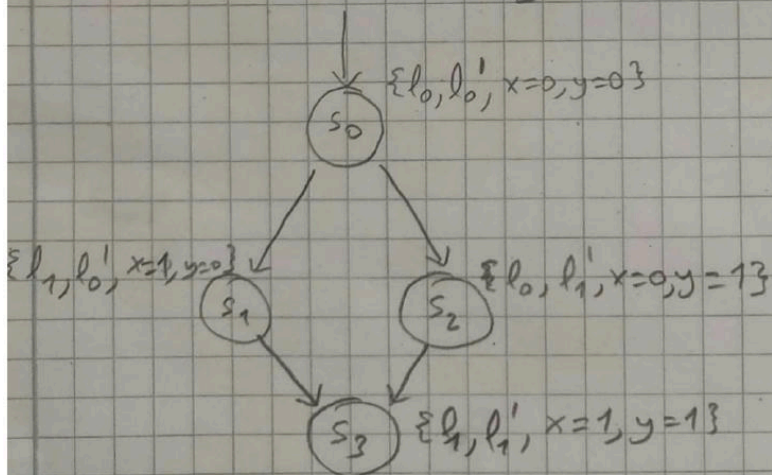

AP =  $\{l_0, l_1, x=0, x=1\}$

$T_{P_2}$ :

AP =  $\{l_0, l_1, y=0, y=1\}$

d)  $T_{P_1} \parallel T_{P_2} = T_{P_1 \parallel P_2}$

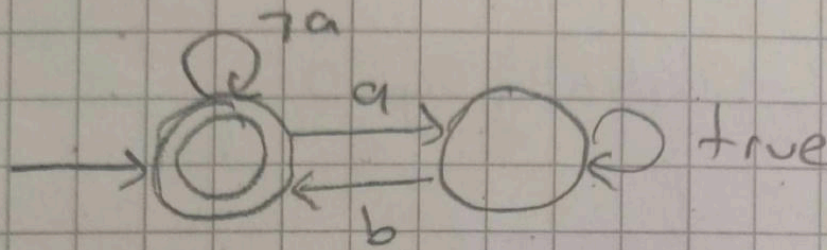

AP:  $\{l_0, l_1, l_0', l_1', x=0, x=1, y=0, y=1\}$

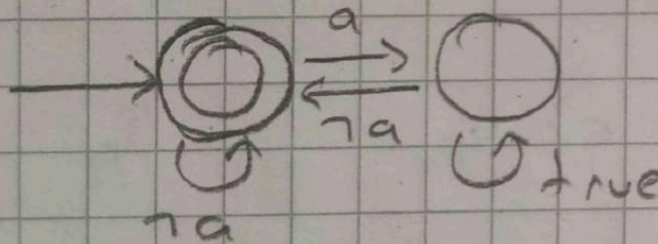

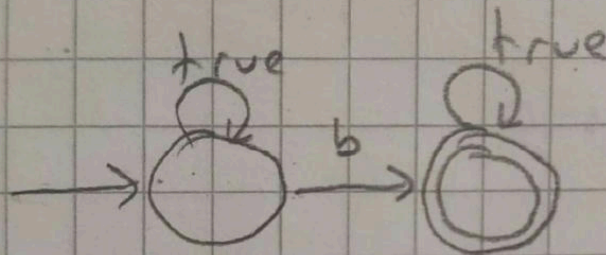

## Exercise 2: From LTL to NBA and Back

2)

a)

b)

c)  $\Box(\neg b \vee \bigcirc(\neg a \cup \neg a \wedge \neg b))$

d)  $c \wedge \bigcirc((a \wedge c) \vee (\neg a \wedge \neg b)) \wedge \bigcirc \bigcirc a$

### Exercise 3: LT Properties for a Program

$$AP = \{x = 0, x > 1\}$$

Assuming that “x is equal to 0” doesn’t hold for  $AP = \{x = 0, x > 1\}$  and only holds for  $AP = \{x = 0\}$ . Similar assumption is made for “x differs from 0” as well.

#### Part A

- a)  $\{A_0 A_1 \dots \in (2^{AP})^\omega \mid \text{false}\}$
- b)  $\{A_0 A_1 \dots \in (2^{AP})^\omega \mid \{x = 0\} = A_0\}$
- c)  $\{A_0 A_1 \dots \in (2^{AP})^\omega \mid \{x > 1\} = A_0\}$
- d)  $\{A_0 A_1 \dots \in (2^{AP})^\omega \mid \{x = 0\} = A_0 \wedge \exists i \in \mathbb{N}_1. \{x = 1\} = A_i\}$
- e)  $\{A_0 A_1 \dots \in (2^{AP})^\omega \mid \forall i \in \mathbb{N}. \{x > 1\} \neq A_i\}$
- f)  $\{A_0 A_1 \dots \in (2^{AP})^\omega \mid \exists i \in \mathbb{N}. \{x > 1\} = A_i\}$
- g)  $\{A_0 A_1 \dots \in (2^{AP})^\omega \mid \text{true}\}$

#### Part B

- a) It’s a safety property because it satisfies the condition that all traces that are not in the language has a bad prefix. Since there are no traces in the property, any finite trace is a bad prefix for this language.
- b) It’s a safety property with  $\text{BadPref} = \{A_0 A_1 \dots A_n \in (2^{AP})^+ \mid \{x = 0\} \neq A_0\}$
- c) It’s a safety property with  $\text{BadPref} = \{A_0 A_1 \dots A_n \in (2^{AP})^+ \mid \{x > 0\} \neq A_0\}$
- d) It’s not a safety property. One counter example is  $\sigma = \{x = 0\}^\omega$ .  $\sigma$  does not satisfy this lt property, however all of it’s finite prefixes can be extended to satisfy the property by appending  $\{x > 1\}$  at some point. Therefore, this trace doesn’t have any prefix that is a bad prefix of the language of this property.
- e) It’s not a safety property because it’s a liveness property. It’s a liveness property because for any finite prefix we can extend it so that  $\{x > 1\}$  does not appear infinitely often.
- f) Similar to part e), this is also a liveness property because we can extend any finite prefix such that  $\{x > 1\}$  appears infinitely often. Therefore it’s not a safety property.
- g) It’s a safety property, because there are no traces that is not in the language of this property. Therefore it satisfies the safety property condition trivially.

### Exercise 4: Fair Equivalence

**a)**

If  $\varphi_1 \equiv_{\text{fair}} \varphi_2$  and  $\psi_1 \equiv_{\text{fair}} \psi_2$ , then  $(\varphi_1 \vee \psi_1) \equiv_{\text{fair}} (\varphi_2 \vee \psi_2)$ .

We know that  $(\varphi_1 \vee \psi_1) \equiv_{\text{fair}} (\varphi_2 \vee \psi_2)$  is equivalent to  $\text{fair} \rightarrow (\varphi_1 \vee \psi_1) \equiv \text{fair} \rightarrow (\varphi_2 \vee \psi_2)$ .

We need to show that:

1.  $\text{Words}(\text{fair} \rightarrow (\varphi_1 \vee \psi_1)) \subseteq \text{Words}(\text{fair} \rightarrow (\varphi_2 \vee \psi_2))$
2.  $\text{Words}(\text{fair} \rightarrow (\varphi_2 \vee \psi_2)) \subseteq \text{Words}(\text{fair} \rightarrow (\varphi_1 \vee \psi_1))$

Then the equivalence holds.

Without loss of generality, we can prove just the lemma 1. Lemma 2. can be proven in the same fashion.

Let  $\sigma \models \text{Words}(\text{fair} \rightarrow (\varphi_1 \vee \psi_1))$ . Then:

1.  $\sigma \not\models \text{fair}$ : Then  $\sigma \models \text{fair} \rightarrow (\varphi_2 \vee \psi_2)$  holds trivially.
2.  $\sigma \models \text{fair}$ : Then we also know that  $\sigma \models (\varphi_1 \vee \psi_1)$ . Then we have the following cases:
  1.  $\sigma \models \varphi_1$ : Then from  $\varphi_1 \equiv_{\text{fair}} \varphi_2$  we can claim  $\sigma \models \varphi_2$  as well. And therefore  $\sigma \models (\varphi_2 \vee \psi_2)$ . Hence,  $\sigma \models \text{fair} \rightarrow (\varphi_2 \vee \psi_2)$ .
  2.  $\sigma \models \psi_1$ : Then from  $\psi_1 \equiv_{\text{fair}} \psi_2$  we can claim  $\sigma \models \psi_2$  as well. And therefore  $\sigma \models (\psi_2 \vee \psi_2)$ . Hence,  $\sigma \models \text{fair} \rightarrow (\varphi_2 \vee \psi_2)$ .

Since  $\forall \sigma \in \text{Words}(\text{fair} \rightarrow (\varphi_1 \vee \psi_1))$ .  $\sigma \in \text{Words}(\text{fair} \rightarrow (\varphi_2 \vee \psi_2))$ ,  $\text{Words}(\text{fair} \rightarrow (\varphi_1 \vee \psi_1)) \subseteq \text{Words}(\text{fair} \rightarrow (\varphi_2 \vee \psi_2))$ . Applying the same steps for the other direction we can conclude that  $(\varphi_1 \vee \psi_1) \equiv_{\text{fair}} (\varphi_2 \vee \psi_2)$  ■

**b)**

If  $\varphi_1 \equiv_{\text{fair}} \varphi_2$ , then  $(\bigcirc \varphi_1) \equiv_{\text{fair}} (\bigcirc \varphi_2)$ .

We know that  $(\bigcirc \varphi_1) \equiv_{\text{fair}} (\bigcirc \varphi_2)$  is equivalent to  $\text{fair} \rightarrow (\bigcirc \varphi_1) \equiv \text{fair} \rightarrow (\bigcirc \varphi_2)$ .

We need to show that:

1.  $\text{Words}(\text{fair} \rightarrow (\bigcirc \varphi_1)) \subseteq \text{Words}(\text{fair} \rightarrow (\bigcirc \varphi_2))$
2.  $\text{Words}(\text{fair} \rightarrow (\bigcirc \varphi_2)) \subseteq \text{Words}(\text{fair} \rightarrow (\bigcirc \varphi_1))$

Then the equivalence holds.

Without loss of generality, we can prove just the lemma 1. Lemma 2. can be proven in the same fashion.

Let  $\sigma \models \text{fair} \rightarrow (\bigcirc \varphi_1)$ . Then:

1.  $\sigma \not\models \text{fair}$ : Then  $\sigma \models \text{fair} \rightarrow (\bigcirc \varphi_2)$  holds trivially.
2.  $\sigma \models \text{fair}$ : Then we also know that  $\sigma \models (\bigcirc \varphi_1)$ . Let  $\sigma' = \sigma[1..]$ . We know that  $\sigma' \models \varphi_1$ . Also  $\sigma' \models \text{fair}$  because  $\sigma'$  is a suffix of  $\sigma$ . So  $\sigma' \models \text{fair} \rightarrow \varphi_1$ . From  $\varphi_1 \equiv_{\text{fair}} \varphi_2$ , we can conclude that  $\sigma' \models \text{fair} \rightarrow \varphi_2$ . And because  $\sigma' \models \text{fair}$ ,  $\sigma' \models \varphi_2$  also holds. Thus  $\sigma \models (\bigcirc \varphi_2)$ . Hence we conclude  $\sigma \models \text{fair} \rightarrow (\bigcirc \varphi_2)$ .

Since  $\forall \sigma \in \text{Words}(\text{fair} \rightarrow (\bigcirc \varphi_1))$ .  $\sigma \in \text{Words}(\text{fair} \rightarrow (\bigcirc \varphi_2))$ ,  
 $\text{Words}(\text{fair} \rightarrow (\bigcirc \varphi_1)) \subseteq \text{Words}(\text{fair} \rightarrow (\bigcirc \varphi_2))$ . Applying the same steps for  
the other direction we can conclude that  $(\bigcirc \varphi_1) \equiv_{\text{fair}} (\bigcirc \varphi_2)$  ■

c)

If  $\varphi_1 \equiv_{\text{fair}} \varphi_2$   $\psi_1 \equiv_{\text{fair}} \psi_2$ , then  $(\varphi_1 U \psi_1) \equiv_{\text{fair}} (\varphi_2 U \psi_2)$ .

We know that  $(\varphi_1 U \psi_1) \equiv_{\text{fair}} (\varphi_2 U \psi_2)$  is equivalent to  
 $\text{fair} \rightarrow (\varphi_1 U \psi_1) \equiv \text{fair} \rightarrow (\varphi_2 U \psi_2)$ .

We need to show that:

1.  $\text{Words}(\text{fair} \rightarrow (\varphi_1 U \psi_1)) \subseteq \text{Words}(\text{fair} \rightarrow (\varphi_2 U \psi_2))$
2.  $\text{Words}(\text{fair} \rightarrow (\varphi_2 U \psi_2)) \subseteq \text{Words}(\text{fair} \rightarrow (\varphi_1 U \psi_1))$

Then the equivalence holds.

Without loss of generality, we can prove just the lemma 1. Lemma 2. can be  
proven in the same fashion.

Let  $\sigma \models \text{fair} \rightarrow (\varphi_1 U \psi_1)$ . Then:

1.  $\sigma \not\models \text{fair}$ : Then  $\sigma \models \text{fair} \rightarrow (\varphi_2 \vee \psi_2)$  holds trivially.
2.  $\sigma \models \text{fair}$ : Then it must follow that  $\sigma \models \varphi_1 U \psi_1$ . There exists an  $i \in \mathbb{N}$  such  
that  $\sigma[i..] \models \psi_1$  and  $\forall j \in \mathbb{N}. j < i \rightarrow \sigma[j..] \models \varphi_1$ .

Since every suffix of  $\sigma$  is also fair, from  $\varphi_1 \equiv_{\text{fair}} \varphi_2$  we can conclude  
 $\forall j \in \mathbb{N}. j < i \rightarrow \sigma[j..] \models \varphi_2$ . And similarly from  $\psi_1 \equiv_{\text{fair}} \psi_2$  we can conclude  
 $\sigma[i..] \models \psi_2$ . Therefore  $\sigma \models \varphi_2 U \psi_2$  where the break point is  $i$ . Then  
 $\sigma \models \text{fair} \rightarrow \varphi_2 U \psi_2$ .

Since  $\forall \sigma \in \text{Words}(\text{fair} \rightarrow (\varphi_1 U \psi_1))$ .  $\sigma \in \text{Words}(\text{fair} \rightarrow (\varphi_2 U \psi_2))$ ,  
 $\text{Words}(\text{fair} \rightarrow (\varphi_1 U \psi_1)) \subseteq \text{Words}(\text{fair} \rightarrow (\varphi_2 U \psi_2))$ . Applying the same steps  
for the other direction we can conclude that  $(\varphi_1 U \psi_1) \equiv_{\text{fair}} (\varphi_2 U \psi_2)$  ■
